

Title:

Given sequence $k = k_1 < k_2 < \dots < k_n$ of n sorted keys, with a search probability p_i for each key k_i . Build the Binary search tree that has the least search cost given the access probability for each key?

Objectives:

1. To understand concept of OBST.
2. To understand concept & features like extended binary search tree.

Learning Objectives:

To understand concept of OBST.

To understand concept & features like extended binary search tree.

Learning Outcome:

Define class for Extended binary search tree using Object Oriented features.

Analyze working of functions.

Theory:

An optimal binary search tree is a binary search tree for which the nodes are arranged on levels such that the tree cost is minimum.

For the purpose of a better presentation of optimal binary search trees, we will consider “extended binary search trees”, which have the keys stored at their internal nodes. Suppose “ n ” keys k_1, k_2, \dots, k_n are stored at the internal nodes of a binary search tree. It is assumed that the keys are given in sorted order, so that $k_1 < k_2 < \dots < k_n$.

An extended binary search tree is obtained from the binary search tree by adding successor nodes to each of its terminal nodes as indicated in the following figure

by squares:

Binary search tree

Extended binary search tree

In the extended tree:

The squares represent terminal nodes. These terminal nodes represent unsuccessful searches of the tree for key values. The searches did not end successfully, that is, because they represent key values that are not actually stored in the tree;

The round nodes represent internal nodes; these are the actual keys stored in the tree;

Assuming that the relative frequency with which each key value is accessed is known, weights can be assigned to each node of the extended tree ($p_1 \dots p_6$). They represent the relative frequencies of searches terminating at each node, that is, they mark the successful searches.

If the user searches a particular key in the tree, 2 cases can occur:

- 1 – the key is found, so the corresponding weight „ p “ is incremented;
- 2 – the key is not found, so the corresponding „ q “ value is incremented.

GENERALIZATION:

The terminal node in the extended tree that is the left successor of k_1 can be interpreted as representing all key values that are not stored and are less than k_1 . Similarly, the terminal node in the extended tree that is the right successor of k_n , represents all key values not stored in the tree that are greater than k_n . The terminal

node that is successes between k_i and k_{i-1} in an inorder traversal represent all key values not stored that lie between k_i and $k_i - 1$.

ALGORITHMS

We have the following procedure for determining $R(i, j)$ and $C(i, j)$ with $0 \leq i \leq j \leq n$:

```
PROCEDURE COMPUTE_ROOT(n, p, q; R, C)
begin
  for i = 0 to n do
    C(i, i) ← 0
    W(i, i) ← q(i)
    for m = 0 to n do
      for i = 0 to (n - m) do
        j ← i + m
        W(i, j) ← W(i, j - 1) + p(j) + q(j)
        *find C(i, j) and R(i, j) which minimize the tree cost
      end
```

The following function builds an optimal binary search tree

```
FUNCTION CONSTRUCT(R, i, j)
begin
  *build a new internal node N labeled (i, j)
  k ← R(i, j)
  if i = k then
    *build a new leaf node N'' labeled (i, i)
  else
    *N'' ← CONSTRUCT(R, i, k)
    *N'' is the left child of node N
  if k = (j - 1) then
    *build a new leaf node N''' labeled (j, j)
  else
    *N''' ← CONSTRUCT(R, k + 1, j)
    *N''' is the right child of node N
  return N
end
```

COMPLEXITY ANALYSIS:

The algorithm requires $O(n^2)$ time and $O(n^2)$ storage. Therefore, as „n“ increases it will run out of storage even before it runs out of time. The storage needed can be reduced by almost half by implementing the two-dimensional arrays as one-dimensional arrays.

Software Required: g++ / gcc compiler- / 64 bit Fedora, eclipse IDE

Input: 1.No.of Element.

2. key values

3. Key Probability

Output: Create binary search tree having optimal searching cost.

Conclusion: This program gives us the knowledge OBST, Extended binary search tree.
